

## KNOW WHAT IT ARRIVES - BUT SAFELY. WITH ENTIRETEC, THE SUITABLE SECURITY SOLUTION FOR YOUR COMPANY.

IT is everywhere. It determines our everyday life. However is IT security thought of everywhere? With our Security Services you increase network security, minimize risks and ensure holistic protection of your corporate values.

### YOUR ADVANTAGES:

- State-of-the-art security services, which can be combined as required, via a uniform platform
- Protection against new, dynamic threats through constant development of services in close cooperation with leading security vendors
- Available top experts with technical knowledge on the latest technologies and thus relieving your own IT team
- Uniform security standards in all locations tailored to your security guidelines
- Flexibility and scalability as needed to respond to changing business needs

### SERVICE COMPANY:

- Tailored 24x7 operation with proactive monitoring and custom SLAs
- Complete service transparency through customized dashboards in the web-based Service Portal
- Global Security Services based on ITIL best practices

The network is the central nervous system of your company. All data converges here, it is essential for effective collaboration of your business units. To keep the network intact, firewalling and secure connections are standard features and are the bases of all security concepts.

At the same time, the network is also the gateway to the world. The boundaries to public areas are fluid, employees and data so mobile and disconnected from location and devices as never before. A challenge for your IT, as it also makes effective protection against hacker attacks, malware or data espionage more difficult than ever.

In addition, trends such as BYOD, the Internet of Things (IoT), virtualization and the cloud, while undoubtedly boosting the business performance of your business, are also increasing the potential for cybercrime. A thorough analysis of the HTTP and DNS protocols, which are used to transmit virtually all data today, will become indispensable.

## WITH SAFETY TO SUCCESS

The reliable, comprehensive protection of your network with tailor made security concepts is therefore becoming increasingly business critical and is a key factor in the success of your company. For this reason, security should be an integral part of any IT solution - whether at work, in the network, or in the data center.

Our Security Services support you in the professional security of your network. They combine technical security with information security to provide holistic protection to protect your assets and data from unwanted attacks and minimize risk.

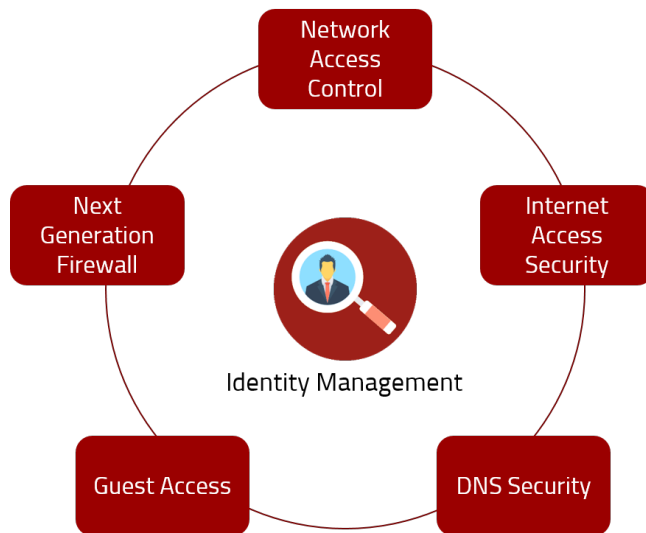

We support you with expertise and use our analytical and design expertise to optimize security services to meet the specific needs of your business. Our project team handles the rollout of solutions worldwide and seamlessly transfers to 24x7 operations.

### NGFW | Next Generation Firewall

Port-based firewalls can no longer meet the demands of today's globally distributed cloud applications due to the high number and flexibility of servers and communication relationships. Our next generation firewall service supplements classic firewall functionalities with state of the art application specific defenses such as intrusion prevention, SSL inspection or malware protection, and also makes it possible to efficiently identify non-proxy cloud services and unlock the corresponding access for users.

### IAS | Internet Access Security

Threats can hide on legitimate websites or in pop-ups, employees unconsciously compromising your business by clicking where they should not. Protect yourself and your users on the web and keep an eye on all Internet activities. With our Internet Access Security Service, you can gain secure access to the Internet, block malware and guarantee seamless enforcement of your security policies. We combine modern on premise solutions with Cloud Services into a hybrid deployment scenario tailored to the needs of your company - flexibly scalable for all locations worldwide.

## OUR SECURITY SERVICES WORK HAND IN HAND

Our job is to secure your network. All the services in our security portfolio work seamlessly together, giving you complete protection for your company, enabling you to respond more quickly and achieve more.

### NAC | Network Access Control

Today, networks must ward off a multitude of threats without hindering legal users. With our Network Access Control Service we create transparency in the LAN and WLAN and protect your network against unauthorized access. The solution identifies each device and grants only those devices access to files and data that are authorized. In addition, all accesses are logged so that when attacks or other irregularities can be tracked, who, when, where and what accessed the network.

### DNS Sec | DNS Security

It is widely available but generally not well secured - the Domain Name System (DNS). For criminals, it has therefore become an easy target to attack networks. The number of DNS-based attacks has increased significantly, often with devastating consequences for the company. With our DNS Security Service, you can proactively detect and eliminate vulnerabilities, minimizing the risk of DNS attack and building a multi-layered defense strategy to combat these modern threats and DNS malware.

### ETSpot | Guest Access

Internet access for guests has long been a must-have, whether in the conference center, hotel, on the university campus, in the hospital or in the company. What is so natural must also work: reliably and with the highest quality. With our Guest Access Service ETSpot you can provide your guests with secure, user-friendly and device-independent access to Internet and network resources. Different authentication options including social networks and a responsive web design of the landing page guarantee easy handling.
